                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DOIA16

Mypertrehalosemic hormone I - stick insect (Carausius morosus)

MyAternate names: neuropeptide Cam-HrTH-I

MYALernate names: neuropeptide Cam-HrTH-I

MYACONtains: hypertrehalosemic factor II

C,Species: Carausius morosus

C;Accession: JC1416; S07157

R;Gaede, G;; Kellner, R.; Rinehart, K.L.; Proefke, M.L.

Biochem. Biophys. Res. Commun. 189, 1303-1309, 1992

A;Title: A tryptophan-substituted member of the AKH/RPCH family isolated from a stick

A;Reference number: JC1416; MUID:93129188
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A;Wolecule type: protein

1- FUNCTION: THIS HORMONE, RELEASED FROM CELLS IN THE CORPORA CARDIACA AFTER THE BEGINNING OF FLIGHT, CAUSES RELEASE OF DIGLYCERIDES FROM THE FAT BODY AND THEN STIMULATES THE FLIGHT MUSCLES TO USE THESE DIGLYCERIDES AS AN ENERGY SOURCE.

1- SIMILARITY: DELONGS TO THE AKH / HRTH / RPCH FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SPECIES-P.americana;

Primary structure of two neuropeptide hormones with adipokinetic and
hypotrahalosemic activity isolated from the corpora cardiaca of horse
files (Diptera).";

Proc. Natl. Acad. Sci. U.S.A. 86:8161-8164(1989).

-I-FUNCTION: HYPERTREHALOSABARIC RACTORS ARE NEUROPEPTIDES THAT
ELEVATE THE LEVEL OF TREHALOSE IN THE HEMOLYMPH (TREHALOSE IS
THE MAJOR CARBOHYDRATE IN THE HEMOLYMPH OF INSECTS).

-I-SIMILARITY: BELONGS TO THE AKH / HRTH / RPCH FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The Bacteroldes stercoris H-15."

L J. Blochem. 128:323-328(2000)

- I- FUNCTION: DEGRADES HEPARIN AND HEPARAN SULFATE.

- CATALYTIC ACTIVITY: ELIMINATIVE CLENYAGE OF POLYSACCHARIDES CONTAINING 1, 4-LINKED GLUGURONATE OR IDDRONATE RESIDUES AND 1,4-CINED 2-SULFOAMINO-2-DEOXY-6-SULFO-D-GLUGOSE RESIDUES TO GIVE OLIGOSACCHARIDES WITH TERMINAL 4-DEOXY-ALPHA-D-GLUC-4-CINED CONTAINING 1, 4-LINKED STROWS AT THEIR NON-REDUCING ENDS.

- ENDIVAR REGULATION: INHIBITED BY CUPRIC ION, LEAD AND SOME AGENTS THAT MODIFY HISTIDINE AND CYGFEINE RESIDUES. ACTIVATED BY KCL AND STROWN AND IFY HISTIDINE AND LYGHOLM SIGNATOR SIGNATE OF THE NOTIVE HISTIDINE SIGNATE OF THE NOTIVE HISTIDINE SIGNATE OF THE NOTIVE HISTIDINE SIGNATE OF THE NOTIVE HISTIDINE SIGNATE OF THE NOTIVE HISTIDINE SIGNATE OF THE NOTIVE HISTIDINE SIGNATE OF THE NOTIVE HISTIDINE SIGNATE OF THE NOTIVE HISTIDINE SIGNATE OF THE NOTIVE HISTIDINE SIGNATE OF THE NOTIVE HISTIDINE SIGNATE OF THE NOTIVE HISTIDINE HIS AN ISOELECTRIC POINT OF 8.7. ITS CEPTIFIED

                                                                                                                                                                                             Saccharomyces cerevisiae; complementary peptide; peptide identification;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to the identification of complementary peptides by analysis of protein and nucleotide sequence databases from higher eukaryotic genomes, excluding human and plants. The specific complementary peptides interact with their relevant target proteins encoded in the eukaryote genome. The peptides may be used as reagents and drugs for drug discovery and as lead ligands for drug design and development. The present sequence is a complementary peptide from Saccharomyces cerevisiae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identifying complementary peptides by analysis of protein and nucleotide sequence databases, useful in drug design -

                                                                                                                             The invention relates to the identification of complementary peptides by analysis of protein and nucleotide sequence databases from higher eukaryotic genomes, excluding human and plants. The specific complementary peptides interact with their relevant target proteins and drugs for drug discovery and as lead ligands for drug design and acceptable development. The present sequence is a complementary peptide from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Use of antigenic proteins, peptides, interferon or their encoding DNA, in the manufacture of an agent for the induction of antigen-specific T
                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes the novel use of interferons (IFNs) or DNAs
                                                                                                                                                                                                                                                                                                                                                                                                     Tumor antigenic peptide; interferon; IFN; antigen-specific T cell; virucide; cytostatic; gene therapy; IFN-alpha; cytotoxic T cell; viral infectious disease; SART-1; human.
                                                                                     Identifying complementary peptides by analysis of protein and nucleotide sequence databases, useful in drug design -

capable of expressing the interferons and/or antigenic proteins (AP), antigenic peptides derived from the proteins or DNAs capable of expressing the antigenic proteins or peptides, in the manufacture of an agent for induction of antigen-specific r cells. The products of the invention have virucide and cytostatic activity and can be used for interferon as inducers of antigen-specific r cells. The action of interferon alpha (IRN-alpha) in a system for inducing specific cytotoxic Freund's adjuvant (IRN) emulsion preparation form was evaluated. IFNs (or inducing antigen-specific r cells in an individual who has been inducing antigen-specific r cells in an individual who has been is useful for DNA encoding RPNs) are useful in an individual who has been administered with AP (or DNA encoding AP) or vice versa. The medicament is useful for the treatment or prophylaxis of a tumor or a viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a set of peptide ligands consisting of specific complementary peptides to proteins encoded by genes of plant genomes. The present sequence is one such peptide from Arabidopsis thaliana. The peptides of the present invention are useful in an assay to identify a peptide, especially a peptide pesticide or harbicide. The peptides are also useful for tools for agricultural research and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A set of peptide ligands for agricultural research and development of therapeutic agents comprise specific complementary peptides to proteins

Speptide sequences (see AAW$4286-90), respectively designated RM-1, RM-13, RM-23 and RM-28, represent a peptide library derived rM-18, RM-11, RM-23 and RM-28, represent a peptide library derived continuous responses to the proposition of the pleckstrin homology (PH) compared to the DNA region (see AAV$6482-86) generated by random so in-frame mutant sequences (see AAV$6482-86) generated by random so in-frame mutant sequences (see AAV$6482-86) generated by random so the DNA region (see AAV$648) encoding the AB loop.

The average free energy of folding of mutant loop AB peptide RM-18 compared with -39 KJ/mol for the progenitor sequence. The average free energy of folding of the 5 mutant sequence. The average free energy of folding of the 5 mutant compared with a structural integrity or the folding stability of the progenitor the structural integrity or the folding stability of the progenitor domain. The invention provides vectors that are used for the production of PH domain-like peptide libraries, which can be production of the may be especially novel binding or catalytic properties, and which may be repeated in research or therapy, or as vaccines. Novel synthetic protein structural templates for the generation, screening and evolution of functional molecular surfaces are provided.
                                                                                                                                                                                                                                                                                                                                                                                                   Vectors used to produce PH domain-like peptide libraries - which are screened for therapeutically useful peptide(s), e.g. to produce

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            specific complementary peptides to proteins encoded by genes of plant specific complementary peptides to proteins encoded by genes of plant thaliana. The present sequence is one such peptide from Arabidopsis thaliana. The peptides of the present invention are useful in an assay to identify a peptide, especially a peptide pesticide or herbicide. The peptides are also useful for tools for agricultural research and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to a set of peptide ligands consisting of

The present invention describes peptides that selectively home to a tissue or organ. The peptides can be used for identifying an organ or tissue, for identifying a target molecule expressed by an organ or tissue or for treating an organ or tissue pathology, where the organ or tissue is selected from prostate, lung, skin, retina, pancreas, gut, membrane dipeptidase (MDP). AXY48618 to AAX49066 represent sequences which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0; Gaps
                                                                                                                                                                                                                                                     New peptides which selectively home to organs or tissues, used for, e.g. identifying target ligands and for therapy of pathological

cytostatic activity. The invention also describes (a) immunogenic protein cytostatic activity. The invention also describes (a) immunogenic protein cytostatic activity. The invention also describes (a) immunogenic protein composition for parentaral, topical, oral or local administration containing at least 1 C42 or (I); (c) an isolated DNA (II) encoding C42 (e) antibodies (Ab) raised against C42 or (I). C42 and its fragments; (d) a recombinate DNA (II) and containing at least 1 cappone against C42 or (I). C42 and its fragments compatibility complex molecules, a cellular immune response c72, and its fragments are used for immunotherapy of cancers that express C42 (particularly of lung, breast and esophagus), to raise specific antibodies (Ab) and for diagnosis, e.g. to detect induction of an immune response and for optimization of transment. Ab are used therapeutically centers that express C42, when conjugated to a cytocoxin) or for diagnosis or monitoring of cancers that express C42. Nucleic acid (II) that encodes C42 can also be very cancers that express C42 as antitumor vaccines.
                                                                                  Tumor-associated antigen C42, and related nucleic acids and antibodies, useful in immunotherapy of cancer and for diagnosis -
                                                                                                                                                                    This invention describes a novel tumor-associated antigen C42 which has

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         generated from the human genome. The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided in the specification.

```

```
The present sequence represents a mimotope which functionally mimics a binding site for a monoclonal antibody (MAb) which recognises an epitope within the human platelet glycoprotein (gp) ID/IX complex. More specifically the MAb is C-34. The mimotope peptide can be used for ratising antibodies, as probes to search for anti-mimotopes and to neutralise the inhibitory activity of those antibodies which recognise the epitope which is mimicked by the peptide. Anti-mimotopes can be used to modulate the adhesion, aggregation or agglutination of platelets by affecting von Willebrand factor interaction with the platelets through the gpt ID/IX receptor, e.g. as an anti-thrombotic drug which inhibits the ristocetin induced aggregation of platelets.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The present invention provides peptides which functionally mimic a binding site for a monoclonal antibody, where the monoclonal antibody is creognises an epitope within the human glycoprotein ID/IX complex. Tecognises an epitope within the human glycoprotein ID/IX complex. The peptides AAW1752 to AAW7182 are mimotopes which are capable of binding to monoclonal antibody C-34. The invention also provides an isolated an antibody, a second peptide, a carbohydrate, a DNA molecule can be mantibody, a second peptide, a carbohydrate, a DNA molecule, an RNA molecules or other naturally or chemically synthesised molecules. These drugs. A method has also been described for modulating the adhesion, selecting platelets and exposing them to an anti-mimotope molecule. The selecting platelets and exposing them to an anti-mimotope molecule. The through the glycoprotein ID/IX receptor, which modulates the adhesion, aggregation, or agglutination of the platelets. The peptide mimotopes minitally minitally and the platelets. The peptide mimotopes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The present sequence is a splice-variance region of a transferrin.

Transferrin polypeptides and polynucleotides are used to prevent,

treat or ameliorate a medical condition in e.g. humans, mice, rabbits,

creat, horses, cats, dogs, chickens or sheep. Disorders which are

diagnosed or treated include autoimmune disease e.g. rheumatoid

arthritis, hyperproliferative disorders e.g. neoplasms of the breast

or liver, cardiovascular disorders e.g. cardiac arrest, cerebrovascular

clisorders e.g. cerebral ischemia, angiogenesis, nervous system disorders

disorders e.g. corneal infections caused by bacteria, viruses and

tugia and ocular disorders e.g. corneal infection. The polypeptides can

be used to aid wound healing and epithelial cell polyferation, to

ransplantation, for supporting cell culture of primary tissues, to

regenerate tissues and in chemotaxis. The polypeptides can also be used

analytics at food additive or preservative to increase or decrease storage
                                                                                                                                                                                                                                                                                              Isolated nucleic acid molecule encoding a human tranferrin protein is used in preventing, treating or ameliorating a medical condition -

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 Probe #10289 for gene expression analysis in human cervical cell sample.
 The present invention relates to human single exon nucleic acid probes (SENP). The present sequence is one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sypression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the 'wipo int/pub/published_pot_sequences.

(HUMA-) HUMAN GENOME SCI INC.

Rosen CA, Barash SC, Ruben SM

WPI; 2001-541565/60.

Nucleic acids encoding 3224 human nervous system antigen polypeptides, useful for preventing, diagnosing and/or treating nervous system useful for preventing, dicancers and metastases -

Disclosure; SEQ ID NO 9586; 1701pp + Sequence Listing; English.

The invention relates to novel genes (ABA11004-ABA21534) and proteins (ABB14678-ABB18001) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. Isolated from a range of human tissues disclosed in the specification. Isolated from a range of human tissues and (ant)agonists are useful. The nucleic acids, proteins, antibodies and (ant)agonists are useful. The nucleic acids, proteins, antibodies and (ant)agonists are useful. The diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancers of the adrenal gland, bone, bone arrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune continuate thyroiditis, diabetes mellitus, Crohn's diseases, multiple sclerosis, rheumatoid arthritis and ulcerative diseases, multiple sclerosis, rheumatoid arthritis and ulcerative collis; (c) cardiovascular disorders such as mycocardial ischaemias; (d) wound healing; (e) neurological diseases such as viral, bacterial, fungal of parasitic infectious diseases such as viral, bacterial, fungal note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp. wipo.int/pub/published_pct_sequences.

 A soluble heterodimeric T-cell receptor (TCR) which contains an beba subunit connected by disulphide bonding to a beta subunit can be used to detect and analyse the peptide and MHC/HLA molecular constituents of TCR ligands. The TCR is useful to reduce the activation of pathogenic T cells in a mammal, and to immunise galans TCR antigenic Structures on the surface of such cells e.g to prevent graft rejection. It can also be used to deplete pathogenic T-cells or inhibit their activation in a female's offspring by TCR and antibodies directed against it can also be used to deplete peripheral lymphocyte T-cells involved in T-cell mediated disease in a mammal or its offspring, particularly diabetes. The TCR can also be used to desease in a mammal or its offspring, particularly diabetes. The

 A soluble single chain T-cell receptor (scTCR) (AAR97725) comprises the V-beta region of conalbumin-specific D10 T-cell receptor (ATCC TIB 224) joined to the D10 V-alpha region via a linker peptide. It cloning into a vector that encodes the lanker. The entire scrCR sequence (AAR729757) is then cloned into vector pR998 which encodes is expressed in E. coli and purified by affinity chromatography. The MBP-D10 scrCR fusion protein Thrombin cleavage yields a soluble scTCR useful in detection, diagnosis, functional studies and therapy involving immune responses.
 Gaps
 New fusion proteins comprising a single chain T-cell receptor - used to develop prods. for use in detection, diagnosis, functional studies and therapy involving immune responses

AAA AAA79263 to AAA79736 and AAB25100 to AAB25570 represent polynucleotide

and protein sequences isolated from eucalyptus (Eucalyptus grandis) or

and protein sequences.

C and protein sequences

c pine (Pinus radiata also known as Monterey pine). The protein sequences

are involved in cell signalling. The polynucleotide and protein

c sequences can be used to modify the response of plant cells to external

c signals e.g. environmental changes or pathogens during the growth and

c signals e.g. environmental changes or pathogens during the growth and

c development of a plant. They can be used to modify cell proliferation,

differentiation, elongation and survival, resistance to disease and

nutrient metabolism. Examples of modifications which can be produced are

nutrient metabolism. Examples of claves and flowers e.g. to

altered fruit ripening and senescence of leaves and flowers e.g. to

clein senescence and prolong the life of cut flowers or enhance

senescence and prolong the life of cut flowers or enhance

c senescence and prolong the life of cut flowers or enhance

congans providing fruit and vegetables which have a longer shelf life

c organs providing fruit and vegetables which have a longer shelf life

c organs providing fruit or degrables which have a longer shelf life

c forest tree species giving long stretches of valuable knot free clear

c wood which can be used in solid timber furniture and veneers.

The present invention relates to novel plant transcription factors from Eucalyptus grandis or Pinus radiata. The present sequence is one such transcription factor. The transcription factor may be used to produce a plant having modified gene expression such as a woody plant e.g. or eucalyptus, pine, acacia, poplar, sweetgum, teak, or mahogany species or to modify the activity of a polypeptide in a plant. The transcription factors of the present invention are members from the following families of requilatory proteins: bZIP, bZIP family of G-box binding families hellx-loop-helix zipper, homeotic/homeodomain/homeobox/WADS, homeodomain zipper, LIM domain, AP2 and EREBS, zinc finger domains of type 2 Cys2His2, CCAAT box elements and MYB.

 The sequence is that of a protein tyrosine kinase inhibitor contg. D-Tyr or tetrafluoro-Tyr residues. The peptide can be used to inhibit TK-mediated signal transduction and is useful for controlling proliferative diseases, e.g. cancer, psoriasis and to treat viral, inflammatory, alleagle and cardiovascular diseases. See also AAR55302-39.

A set of peptide ligands consisting of specific complementary peptides to proteins encoded by genes of the human genome, useful in an assay for screening and identifying of one or more novel peptides which are drug candidates or pro-drugs.
 Gaps
 Human; complementary peptide; ligand; drug discovery; drug design.
 The invention relates to a set of complementary peptide ligands generated from the human genome. The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided in the specification.

A set of peptide ligands consisting of specific complementary peptides to proteins encoded by genes of the human genome, useful in an assay for screening and identifying of one or more novel peptides which are drug candidates or pro-drugs.
 A set of peptide ligands consisting of specific complementary peptides to proteins encoded by genes of the human genome, useful in an assay for screening and identifying of one or more novel peptides which are
 Gaps
 The invention relates to a set of complementary peptide ligands generated from the human genome. The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present
